10

What is claimed is;

1. A management device for managing a print system comprising a data processor connected to a network and a printer for executing a print job sent from the data processor via the network, the data processor having a first software program which are installed therein, and the printer having a second software program which are installed therein, the device comprising:

deciding controller for determining adaptability between old version and new version for the first software program and the second software program installed in the data processor and the printer; and

updating controller for executing a predetermined

15 process to update the first and the second software programs
on the data processor and the printer based on the determination
result by the determining controller.

- The management device according to claim 1, wherein the updating controller updates the first software program and the second software program in a predetermined order which is defined based on the determination result by the determining controller.
- 25 3. The management device according to claim 2,

10

wherein when the determining controller determines that there is no adaptability between the new version of the first software program and the old version of the second software program, the updating controller updates first the second software program and then updates the first software program.

- 4. The management device according to claim 2, wherein when the determining controller determines that there is no adaptability between the new version of the second software program and the old version of the first software program, the updating controller updates first the first software program and then updates the second software program.
- 5. The management device according to claim 1, wherein the updating controller controls execution and prohibition of update of the first and the second software programs based on the determination result by the determining controller.
- 20 6. The management device according to claim 5, wherein when the determining controller determines that the new version of the first software program is not adaptable to neither of the new version of the second software program and the old version of the second software program, the updating controller prohibits the first software program already

installed from being updated.

- 7. The management device according to claim 5, wherein when the determining controller determines that the new version of the second software program is not adaptable to neither the new version or the old version of the first software program, the updating controller prohibits the second software program already installed from being updated.
- 10 8. The management device according to claim 1, wherein the updating controller sends a message which prompts update of the first and the second software programs to the data processor to display the message, based on the determination result by the determining controller.

15

- 9. The management device according to claim 1, further comprising a memory for storing information about the adaptability between new version and old version for the first software program and the second software program, wherein the determining controller downloads the information about the adaptability via the network into the memory to determine the adaptability based on the downloaded information.
- 10. The management device according to claim 1, 25 wherein the management device is incorporated in the printer.

- 11. The management device according to claim 10, wherein the updating controller receives information about the version of the first software program installed in the data processor, as well as the print job sent from the data processor, and executes said predetermined process based on the received information about the version.
- 12. The management device according to claim 1,

 wherein when the other data processor is connected to the
 network, the updating controller also executes the
 predetermined process to the other data processor.
- 13. The management device according to claim 1,

 5 wherein the first software program controls the data processor to generate a print job corresponding to the printer, and the second software program controls the printer to execute the print job generated by the first software program.
- A management device for managing a print system comprising a data processor and a printer for executing a print job sent from the data processor, the data processor having a first software program installed therein, the printer having a second software program installed therein, the device being capable of being connected to a network and comprising:

5

deciding controller for determining adaptability between old version and new version for the first software program and the second software program, based on adaptability information obtained via the network; and

updating controller for executing a predetermined process to update the installed first software program and the installed second software program based on the determination result by the determining controller.

- 10 15. The management device according to claim 14, wherein the updating controller updates the installed first software program and the installed second software program in a predetermined order which is defined based on the determination result by the determining controller.
- 16. The management device according to claim 15, wherein when the determining controller determines that there is no adaptability between the new version of the first software program and the old version of the second software program, the updating controller updates first the installed second software program and then updates the installed first software program.
- 17. The management device according to claim 15, wherein when the determining controller determines that there

is no adaptability between the new version of the second software program and the old version of the first software program, the updating controller updates first the first software program and then updates the second software program.

5

- 18. The management device according to claim 14, wherein the updating controller controls execution and prohibition of update of the first and the second software programs based on the determination result by the determining controller.
- 19. The management device according to claim 18, wherein when the determining controller determines that the new version of the first software is not adaptable to neither the new version nor the old version of the second software program, the updating controller prohibits the first software program already installed from being updated.
- 20. The management device according to claim 18,
 20 wherein when the determining controller determines that the
 new version of the second software program is not adaptable
 to neither of the new version of the first software program
 and the old version of the first software, the updating
 controller prohibits the second software program already
 25 installed from being updated.

- 21. The management device according to claim 14, wherein the updating controller sends a message which prompts update of the first and the second software programs to the data processor to display the message based on the determination result by the determining controller.
- 22. The management device according to claim 14, wherein the network from which the adaptability information is obtained is a wide area network, and the data processor and the printer are connected to a local area network.
 - The management device according to claim 14, further comprising
- periodically a WEB site on which the latest version of the first and the second software programs are registered, determining whether or not the first and the second software programs registered on the WEB site are updated, and activating the determining controller and the updating controller when the first and second software programs are determined to be updated.
- 24. The management device according to claim 23,
 25 wherein the updating controller downloads the first and the

10

15

20

25

second software programs from the WEB site into the printer.

A management method for managing a print system comprising a data processor connected to a network and a printer for executing a print job sent from the data processor via the network, the data processor having a first software program which are installed therein, and the printer having a second software program which are installed therein, the method comprising:

deciding adaptability between old version and new version for the first software program and the second software program installed in the data processor and the printer; and

updating the first and the second software programs on the data processor and the printer by executing a predetermined process to update, based on the determination result.

- The management method according to claim 25, wherein the updating comprises updating the first software program and the second software program in a predetermined order which is defined based on the determination result.
- 27. The management method according to claim 25, wherein the updating comprises controlling execution and prohibition of update of the first and the second software

programs based on the determination result.

28. The management method according to claim 25, wherein the updating comprises sending a message which prompts update of the first and the second software programs to the data processor to display the message, based on the determination result.

- 29. The management method according to claim 25, wherein the determining comprises downloading the information about the adaptability via the network into a memory and determining the adaptability based on the downloaded information.
- 15 30. The management method according to claim 25, wherein the first software program controls the data processor to generate a print job corresponding to the printer, and the second software program controls the printer to execute the print job generated by the first software program.

20

25

A management method for managing a print system comprising a data processor and a printer for executing a print job sent from the data processor, the data processor having a first software program installed therein, the printer having a second software program installed therein, the method

15

20

25

comprising:

deciding adaptability between old version and new version for the first software program installed in the data processor and the second software program installed in the printer based on adaptability information, the adaptability information being obtained via a wide area network; and

updating the installed first software program and the installed second software program by executing a predetermined process to update based on the determination result.

- 32. The management method according to claim 31, wherein the updating comprises updating the installed first software program and the installed second software program in a predetermined order which is defined based on the determination result.
- 33. The management method according to claim 33, wherein the updating comprises controlling execution and prohibition of update of the first and the second software programs based on the determination result.
- 34. The management method according to claim 31, wherein the updating comprises sending a message which prompts update of the first and the second software programs to the

data processor to display the message based on the determination result.

35. The management method according to claim 31,5 further comprising:

accessing periodically a WEB site on which the latest version of the first and the second software programs are registered;

deciding whether or not the first and the second

software programs registered on the WEB site are updated; and

activating the determining controller and the

updating controller when the first and second software programs

are determined to be updated.

A computer program product for managing a print system comprising a data processor connected to a network and a printer for executing a print job sent from the data processor via the network, the data processor having a first software program which are installed therein, and the printer having a second software program which are installed therein, the computer program product comprising:

deciding control for determining adaptability between old version and new version for the first software program and the second software program installed in the data processor and the printer; and

updating control for updating the first and the second software programs on the data processor and the printer by executing a predetermined process to update, based on the determination result by the determining control.

5

10

15

- 37. The computer product according to claim 36, wherein the updating control updates the first software program and the second software program in a predetermined order which is defined based on the determination result by the determining control.
- 38. The computer program product according to claim 36, wherein the updating control controls execution and prohibition of update of the first and the second software programs based on the determination result by the determining control.
- 39. The computer program product according to claim 36, wherein the updating control sends a message which prompts update of the first and the second software programs to the data processor to display the message, based on the determination result by the determining control.
- 40. The computer program product according to claim
 25 36, wherein the determining control downloads the information

about the adaptability via the network into a memory and determines the adaptability based on the downloaded information.

The computer program product according to claim 36, wherein the first software program controls the data processor to generate a print job corresponding to the printer, and the second software program controls the printer to execute the print job generated by the first software program.

10

15

20

25

A computer program product for managing a print system comprising a data processor and a printer for executing a print job sent from the data processor, the data processor having a first software program installed therein, the printer having a second software program installed therein, the computer program product comprising:

deciding control for determining adaptability between old version and new version for the first software program installed in the data processor and the second software program installed in the printer based on adaptability information, the adaptability information being obtained via a wide area network; and

updating control for updating the installed first software program and the installed second software program by executing a predetermined process to update based on the

determination result by the determining control.

The computer program product according to claim 42, wherein the updating control updates the installed first software program and the installed second software program in a predetermined order which is defined based on the determination result by the determining control.

- 44. The computer program product according to claim
 10 42, wherein the updating control controls execution and
 prohibition of update of the first and the second software
 programs based on the determination result by the determining
 control.
- 15 45. The computer program product according to claim 42, wherein the updating control sends a message which prompts update of the first and the second software programs to the data processor to display the message based on the determination result by the determining control.

20

25

The computer program product according to claim 42, further comprising activating control for accessing periodically a WEB site on which the latest version of the first and the second software programs are registered, determining whether or not the first and the second software programs

registered on the WEB site are updated, and activating the determining controller and the updating controller when the first and second software programs are determined to be updated.

5

10

A management device for managing a print system comprising a data processor connected to a network and a printer for executing a print job sent from the data processor via the network, the data processor having a software program installed therein, the printer having a software program installed therein, the device comprising:

detecting controller for detecting whether or not the software program installed in one of the data processor and the printer is updated;

15

deciding controller for determining adaptability between the software program installed in the data processor and the software program installed in the printer in response to the detecting result by the detecting controller; and

20

updating controller for executing a predetermined process to update the software program installed in the other of the data processor and the printer.

48. wher

25

48. The management device according to claim 47, wherein when the determining controller determines that there is no adaptability, the updating controller updates the

software program installed in the other of the data processor and the printer.

49. The management device according to claim 48, wherein when the determining controller determines that there is no adaptability, the updating controller sends a message which prompts update of the software program installed in the other of the data processor and the printer to the data processor to display the message.

10

15

A management method for managing a print system comprising a data processor connected to a network and a printer for executing a print job sent from the data processor via the network, the data processor having a software program installed therein, the printer having a software program installed therein, the method comprising:

detecting whether or not the software program installed in one of the data processor and the printer is updated;

deciding adaptability between the software program installed in the data processor and the software program installed in the printer in response to the detecting result; and

updating the software program installed in the other of the data processor and the printer by executing a

10

predetermined process to update.

- 51. The management method according to claim 50, wherein the updating comprises updating the software program installed in the other of the data processor and the printer, when it is determined that there is no adaptability.
- 52. The management method according to claim 50, wherein the updating comprises sending a message which prompts update of the software program installed in the other of the data processor and the printer to the data processor to display the message, when it is determined that there is no adaptability.
- A computer program product for managing a print system comprising a data processor connected to a network and a printer for executing a print job sent from the data processor via the network, the data processor having a software program installed therein, the printer having a software program installed therein, the computer program product comprising:

detecting control for detecting whether or not the software program installed in one of the data processor and the printer is updated;

deciding control for determining adaptability
25 between the software program installed in the data processor

10

and the software program installed in the printer in response to the detecting result by the detecting control; and

updating control for executing a predetermined process to update the software program installed in the other of the data processor and the printer.

- 54. The computer program product according to claim 53, wherein when the determining control determines that there is no adaptability, the updating control updates the software program installed in the other of the data processor and the printer.
- 55. The computer program product according to claim 53, wherein when the determining control determines that there is no adaptability, the updating control sends a message which prompts update of the software program installed in the other of the data processor and the printer to the data processor to display the message.
